

Temporarily saving a metamodel package

Usually, after applying or exporting your metamodel customizations, the metamodel package is closed without saving. However, if you cannot immediately apply or export the customizations you are working on, or if you want to continue working on the customizations at a later point in time, you can temporarily save the metamodel package, and reopen it when you continue customizing.

Saving a metamodel package

1. On the **File** tab, click **Save As > Computer**.
2. Click **Browse** and navigate to the location where you want to save the metamodel package.
3. Optional: If desired, rename the metamodel package. (Do NOT change the file extension in **Save as type**.)
4. Click **Save**.

Opening a saved metamodel package

- On the **File** tab, click **Open**, go to the location where you have saved the metamodel package, and open it.

When the metamodel package is opened, Enterprise Studio will automatically switch to metamodel mode.
